SYNRIBO® is a prescription medicine used to treat adults with chronic or accelerated phase chronic myeloid leukemia (CML) who are no longer responding to, or who could not tolerate, two or more tyrosine kinase inhibitors (TKI).

Please see Important Safety Information throughout this brochure and the accompanying full Prescribing Information.

A Treatment Option Following TKI Failures

If you are an adult who has already tried 2 or more tyrosine kinase inhibitors (TKIs) to treat your chronic or accelerated phase chronic myeloid leukemia (CML), SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, (pronounced sin-RYE-bow) is a prescription medicine that may be an appropriate treatment option for you.

This guide will help you understand SYNRIBO. However, before this, it’s important to understand more about CML and TKI treatment failure.

Safety Information

Low Blood Counts: SYNRIBO is associated with low blood counts (myelosuppression) that can lead to tiredness, bleeding, or increased risk of infection. Your doctor will regularly check (weekly or every 2 weeks) your blood counts throughout treatment. Low blood counts were usually managed in clinical studies by delaying the next cycle and/or reducing days of treatment. Complications from low blood counts can be severe and/or fatal. Call your doctor immediately if you experience fever, aches, chills, nausea, vomiting, significant tiredness, shortness of breath, or bleeding.
Understanding Chronic and Accelerated Phase CML

There are 4 major types of leukemia, which is a cancer of the blood.

- CML is the rarest of the 4 types
- Around 8,000 people are newly diagnosed with CML each year in the United States
- Approximately 36,000 people are currently living with CML

As CML treatment options have improved, patients with the disease have successfully managed it for longer and longer periods.

TKI therapy is often the first CML treatment after diagnosis. The availability of TKIs has changed the outlook for those with CML—providing responses for most people that may last many years.

However, clinical studies suggest that with each TKI used after a previous TKI failure:

- Discontinuation rates may increase
- Time to discontinuation may decrease

Please see Important Safety Information throughout this brochure and the accompanying full Prescribing Information.
After 2 or More TKI Failures

TKI failure is when treatment is stopped because it isn’t achieving or maintaining its desired response. This is often due to 1 of 2 reasons.

<table>
<thead>
<tr>
<th>INTOLERANCE</th>
<th>RESISTANCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sometimes TKI treatment is stopped because the side effects are too difficult to tolerate.</td>
<td>Sometimes TKI treatment is stopped due to resistance, which means a TKI does not produce a response, or if there was a response, the disease changed over time and treatment became less effective.</td>
</tr>
</tbody>
</table>

After 2 or more TKI failures, CML becomes harder to treat. In the past, patients had limited treatment options.

Safety Information

**Bleeding:** Serious bleeding can occur. Low platelet counts (thrombocytopenia) can lead to bleeding in the brain or severe stomach bleeding, which can sometimes be fatal. Your doctor will regularly check (weekly or every 2 weeks) your blood counts, including platelets, throughout treatment. Call your doctor immediately if you see signs of internal bleeding (unusual bleeding, easy bruising, or blood in urine or stool; confusion, slurred speech, or altered vision).
A Non-TKI Option

For adult patients with chronic or accelerated phase CML who have experienced 2 or more TKI failures, SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, is a non-TKI option that offers another treatment direction.

SYNRIBO is the first protein synthesis inhibitor approved for CML. While a detailed understanding of how SYNRIBO works has not been fully defined, it has been shown to prevent production of specific proteins.

Safety Information

High Blood Sugar Levels: SYNRIBO can cause high blood sugar levels (hyperglycemia). If you have diabetes or are at risk for diabetes, your doctor will check your blood sugar levels often during treatment.

Please see Important Safety Information throughout this brochure and the accompanying full Prescribing Information.
The proteins affected by SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, are known as Bcr-Abl and Mcl-1, as shown in laboratory studies not involving patients. These are examples of some of the proteins that are produced in higher levels by cancerous CML cells and help drive the disease.

As a protein synthesis inhibitor, the way SYNRIBO is believed to work does not directly depend on Bcr-Abl binding.
Clinical Studies

In the study the FDA used to approve SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, there were 111 adults with chronic or accelerated phase CML who had already been treated with at least 2 TKIs.

Those studied may have experienced resistance to their TKI medicine—meaning the TKI did not produce a response, or if there was a response, treatment became less effective over time. Patients may also have had side effects they couldn’t tolerate, causing them to stop treatment.

Please see Important Safety Information throughout this brochure and the accompanying full Prescribing Information.
Effectiveness in Chronic Phase CML Following 2 or More TKI Failures

18% of patients (14/76) in clinical studies achieved a major cytogenetic response (MCyR). This consists of a complete or partial cytogenetic response, meaning 35% or fewer cells have the Philadelphia chromosome associated with CML.

Effectiveness in Accelerated Phase CML Following 2 or More TKI Failures

14% of patients (5/35) in clinical studies achieved a major hematologic response (MaHR), meaning blood cells returned to normal levels (a decrease in high counts of undeveloped cells, platelets, and white blood cells).

Safety Information

Harm to an Unborn Baby: Fetal harm can occur in pregnant women. If you are pregnant or plan to become pregnant, please speak with your doctor before starting treatment.
Receiving Treatment

SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, is given as an injection under the skin. There are 2 options for receiving treatment: home administration or administration by your doctor. You and your doctor will decide which option is best for you.

Home Administration

If your doctor decides that you or a caregiver can inject SYNRIBO, they will explain how to prepare for and perform an injection before you use it for the first time. This will include instruction on how to properly handle, store, and inject SYNRIBO, dispose of used supplies, and clean up any spilled SYNRIBO. Do not attempt to self-inject SYNRIBO before being trained by your doctor or nurse.

Your doctor will arrange for you to receive SYNRIBO syringes that are prepared by a healthcare professional and ready to inject. You will also receive other supplies that you will need to inject SYNRIBO, including protective eyewear, gloves, a biohazard container, absorbent pads, alcohol swabs, gauze pads, and ice packs or a cooler.

The SYNCare support program is available to assist with questions about SYNRIBO home administration. Learn more about SYNCare on page 16.

Please see Important Safety Information throughout this brochure and the accompanying full Prescribing Information.
Home Administration (continued)

Be sure to read the Medication Guide and Instructions for Use that come with this brochure as well as your SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, prescription. They contain important information about the risks of SYNRIBO, and detailed instructions on how to administer injections.

Administration by Your Doctor

If home administration is not an option for you, you will need to have your doctor administer your treatment. During the dosing period of each treatment cycle, you will need to visit your doctor’s office twice daily (approximately every 12 hours) to receive your injections.

Safety Information

Serious side effects (occurring in 5% or more of studied patients) in chronic and accelerated phase CML:

- Inability to produce certain types of blood cells (bone marrow failure)
- Low platelet count (thrombocytopenia)
- Low white blood cell count with a fever (febrile neutropenia)
- Low red blood cell count (anemia) which can leave you easily tired*
- Diarrhea*
- Infections

*Affected 5% or more of accelerated phase patients; affected less than 5% of chronic phase patients.
Treatment Schedule

<table>
<thead>
<tr>
<th>INDUCTION SCHEDULE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>8</td>
</tr>
<tr>
<td>15</td>
</tr>
<tr>
<td>22</td>
</tr>
</tbody>
</table>

SYNRIBO® (omacetaxine mepesuccinate) for injection is given twice daily, about every 12 hours with no limits on food. The initial schedule is followed every 28 days until you achieve hematologic response (a decrease in high counts of undeveloped cells, platelets, and white blood cells). You then move to the maintenance schedule.

SYNRIBO is given as an injection under the skin (subcutaneous injection) of your thigh or stomach-area (abdomen). The injection can be given in the back of the arm if a caregiver is giving the injection.

Please see Important Safety Information throughout this brochure and the accompanying full Prescribing Information.
The maintenance schedule is followed every 28 days as long as you continue to benefit from treatment. Your doctor will check your response to treatment regularly.

Your blood counts will be checked weekly, then every 2 weeks at your doctor’s discretion. The dose of SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, may be changed by your doctor to help address side effects.

Safety Information

The most common side effects (occurring in 20% or more of studied patients) in chronic and accelerated phase CML:

- Decreased blood counts (thrombocytopenia, anemia, neutropenia, or lymphopenia)
- Diarrhea
- Nausea
- Tiredness
- Weakness
- Redness, swelling, or pain at injection site
- Fever
- Infections
Treatment Considerations

What should I tell my doctor before using SYNRIBO® (omacetaxine mepesuccinate) for injection?

Tell your doctor if you:
- have diabetes or a family history of diabetes
- have bleeding problems
- plan to have any dental or surgical procedures
- have any other medical problems
- are pregnant or plan to become pregnant. SYNRIBO can harm your unborn baby. You should not become pregnant during treatment with SYNRIBO. Tell your healthcare provider right away if you become pregnant during treatment with SYNRIBO
- are breastfeeding or plan to breastfeed. It is not known if SYNRIBO passes into your breast milk. You and your healthcare provider should decide if you will take SYNRIBO or breastfeed. You should not do both

Please see Important Safety Information throughout this brochure and the accompanying full Prescribing Information.
Tell your doctor about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements.

What should I avoid while using SYNRIBO?

SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, may cause tiredness. Avoid driving or operating dangerous tools or machinery if you develop tiredness when using SYNRIBO.

How will I know if treatment is working?

Your doctor will regularly check your response to SYNRIBO treatment.

What if I miss an injection?

If you miss a dose of SYNRIBO, just skip the missed dose. Give your next injection of SYNRIBO at your next scheduled time. Do not give 2 doses of SYNRIBO at the same time to make up for a missed dose.
Support That’s Here for You

If your doctor determines that you are a candidate for home administration of SYNRIBO® (omacetaxine mepesuccinate) for injection, talk to your doctor about the SYNCare program.

SYNCare is with you throughout therapy, beginning from the moment your doctor prescribes SYNRIBO. Services are offered at every step of the treatment process, including:

- Arranging for delivery of SYNRIBO directly to your door
- Supplying materials for injection, cleanup, and disposal of injection waste
- Providing self-injection educational materials and resources for you and your doctor
- Being there for you 24/7 with a toll-free hotline

Please see Important Safety Information throughout this brochure and the accompanying full Prescribing Information.
The SYNCare hotline is staffed by trained personnel familiar with SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use, and the self-injection process. Just remember, questions or concerns about your health, disease, and treatment plan should always be directed to your doctor.

Learn more about SYNCare by visiting www.SYNCareSupport.com.

Supporting References

The following publications were used as reference materials in the writing of this guide.

- Chronic Myelogenous Leukemia. NCCN Guidelines for Patients.
- Chronic Myeloid Leukemia. Leukemia & Lymphoma Society.
- SYNRIBO® [Current Prescribing Information]. North Wales, PA: Teva Pharmaceuticals USA, Inc.
The recommended maintenance schedule is 1.25 mg/m² administered subcutaneously until patients achieve a hematologic response. Days every 28 days, over a 28-day cycle. Cycles should be repeated every 28 days subcutaneously twice daily at approximately 12-hour intervals for 14 consecutive days of a 28-day cycle (2.1).

Dose modifications are needed for toxicity (2.3).

Induction Dose: 1.25 mg/m² administered by subcutaneous injection twice daily for 14 consecutive days of a 28-day cycle (2.1).

Maintenance Dose: 1.25 mg/m² administered by subcutaneous injection twice daily for 7 consecutive days of a 28-day cycle (2.2).

Dose modifications are needed for toxicity (2.3).

DOSAGE AND ADMINISTRATION

The recommended maintenance schedule of SYNRIBO® (omacetaxine mepesuccinate) for injection, for subcutaneous use is 1.25 mg/m² administered by subcutaneous injection twice daily at approximately 12-hour intervals for 14 consecutive days of a 28-day cycle (2.1). If SYNRIBO is not used immediately after reconstitution, follow in-use storage instructions. Do not use SYNRIBO if the solution for injection is not clear or colorless and free of particulate matter. Do not use if the solution and container come into contact with skin, eyes, or clothing.

HIGHLIGHTS OF PRESCRIBING INFORMATION

Indication: SYNRIBO is indicated for the treatment of adult patients with chronic or accelerated phase chronic myeloid leukemia (CML) with resistance and/or intolerance to two or more tyrosine kinase inhibitors (TKI) (1).

Dose: 1.25 mg/m² administered by subcutaneous injection twice daily at approximately 12-hour intervals for 14 consecutive days of a 28-day cycle (2.1).

Dosage: SYNRIBO treatment cycles may be delayed and/or the number of days of dosing during the cycle reduced for hematologic toxicities (e.g., neutropenia, thrombocytopenia) [see Warnings and Precautions (5.1)]. Perform complete blood counts (CBCs) weekly during induction and initial maintenance cycles. After initial maintenance cycles, monitor CBCs every two weeks or as clinically indicated. If a patient experiences Grade 4 neutropenia (absolute neutrophil count (ANC) less than 0.5 x 10⁹/L) or Grade 3 thrombocytopenia (platelet counts less than 50 x 10⁹/L) during a cycle, delay starting the next cycle until ANC is greater than or equal to 1.0 x 10⁹/L and platelet count is greater than or equal to 50 x 10⁹/L. Also, for the next cycle, reduce the number of dosing days by 2 days (e.g., to 12 or 5 days).

1 INDICATIONS AND USAGE

SYNRIBO is indicated for the treatment of adult patients with chronic or accelerated phase chronic myeloid leukemia (CML) with resistance and/or intolerance to two or more tyrosine kinase inhibitors (TKI) (1). SYNRIBO is indicated for the treatment of adult patients with chronic or accelerated phase chronic myeloid leukemia (CML) with resistance and/or intolerance to two or more tyrosine kinase inhibitors (TKI) (1).

5 WARNINGS AND PRECAUTIONS

Myelosuppression: severe and fatal thrombocytopenia, neutropenia and anemia. Monitor hematologic parameters frequently (2.3, 5.1).

Bleeding: severe thrombocytopenia and increased risk of hemorrhage. Fatal cerebral hemorrhage and severe, non-fatal gastrointestinal hemorrhage (5.1, 5.2).

Hyperglycemia: glucose intolerance and hyperglycemia including hyperosmolar non-ketotic hyperglycemia (5.3).

Embryo-fetal toxicity: can cause fetal harm. Advise females of reproductive potential to avoid pregnancy (5.4, 8.1).

10 OVERDOSAGE

11 DESCRIPTION

SYNRIBO and SYNRIBO for Injection are lyophilized vials containing 3.5 mg of omacetaxine mepesuccinate as a lyophilized powder (3).

14 CLINICAL STUDIES

To report SUSPECTED ADVERSE REACTIONS, contact Teva Pharmaceuticals USA, Inc. at 1-888-483-8279 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch. See 17 for PATIENT COUNSELING INFORMATION and Medication Guide.
SYNRIBO® (omacetaxine mepesuccinate) for injection

6 ADVERSE REACTIONS

The following serious adverse reactions have been associated with SYNRIBO in clinical trials and are discussed in greater detail in other sections of the label.

- Myelosuppression [see Warnings and Precautions (5.1)]
- Bleeding [see Warnings and Precautions (5.2)]
- Hyperglycemia [see Warnings and Precautions (5.3)]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The safety data for SYNRIBO are from 3 clinical trials which enrolled a total of 163 adult patients with TKI resistant and/or interolent chronic phase (N=108) and accelerated phase (N=55) CML. All patients were treated with initial induction therapy consisting of a dose of 1.25 mg/m² administered subcutaneously twice daily for 14 consecutive days every 28 days (induction cycle). Responding patients were then treated with the same dose and a twice daily schedule for 7 consecutive days every 28 days (maintenance cycle).

Chronic Phase CML

The median duration of exposure for the 108 patients with chronic phase CML was 7.4 months (range 0 to 43 months). The median total cycles of exposure was 6 (range 1 to 41), and the median total dose delivered during the trials was 131 mg/m² (range 1.2 to 678). Among the patients with chronic phase CML, 87% received 14 days of treatment during cycle 1. By cycles 2 and 3, the percentage of patients receiving 14 days of treatment decreased to 42% and 16%, respectively. Of the 91 patients who received at least 2 cycles of treatment, 79% (76/91) had at least 1 cycle delayed during the trials. The median number of days of cycle delays was greater for cycle 2 (17 days) and cycle 3 (25 days) when more patients were receiving induction cycles.

Adverse reactions were reported for 99% of the patients with chronic phase CML. A total of 18% of patients had adverse reactions leading to withdrawal. The most frequently occurring adverse reactions leading to discontinuation were pancytopenia, thrombocytopenia, and increased alanine aminotransferase (each 2%). A total of 87% of patients reported at least 1 Grade 3 or Grade 4 treatment emergent adverse reaction (Table 2).

2.6 Considerations for Home Administration

Before a decision is made to allow SYNRIBO to be administered by someone other than a healthcare professional, ensure that the patient is an appropriate candidate for self-administration or for administration by a caregiver. Provide training on proper handling, storage conditions, administration, disposal, and clean-up of accidental spillage of the product. Ensure that patients receive the necessary supplies for home administration. At minimum these should include:

- Reconstituted SYNRIBO in a syringe with a capped needle for subcutaneous injection. Syringe(s) should be filled to the patient-specific dose.
- Protective eyewear
- Gloves
- An appropriate biohazard container
- Absorbtion pad(s) for placement of administration materials and for accidental spillage
- Alcohol swabs
- Gauze pads

If a patient or caregiver cannot be trained for any reason, then in such patients, SYNRIBO should be administered by a healthcare professional.

2.7 Disposal and Accidental Spillage Procedures

All reactions Grade 3 or 4 reactions

- Before a decision is made to allow SYNRIBO to be administered by someone other than a healthcare professional, ensure that the patient is an appropriate candidate for self-administration or for administration by a caregiver. Provide training on proper handling, storage conditions, administration, disposal, and clean-up of accidental spillage of the product. Ensure that patients receive the necessary supplies for home administration. At minimum these should include:
- Reconstituted SYNRIBO in a syringe with a capped needle for subcutaneous injection. Syringe(s) should be filled to the patient-specific dose.
- Protective eyewear
- Gloves
- An appropriate biohazard container
- Absorbtion pad(s) for placement of administration materials and for accidental spillage
- Alcohol swabs
- Gauze pads

If a patient or caregiver cannot be trained for any reason, then in such patients, SYNRIBO should be administered by a healthcare professional.

2.7 Disposal and Accidental Spillage Procedures

After administration, any unused solution should be discarded properly.

- Gauze pads
- Absorbent pad(s) for placement of administration materials and for accidental spillage
- Alcohol swabs
- Gauze pads

If accidental spillage occurs, continue to use protective eyewear and gloves, wipe the spilled liquid with the absorbent pad, and wash the area with water and soap. Then, place the pad and gloves into the biohazard container and wash hands thoroughly.

Return the biohazard container to the clinic or pharmacy for final disposal.

3 DOSAGE FORMS AND STRENGTHS

SYNRIBO for injection contains 3.5 mg omacetaxine mepesuccinate; as a sterile, preservative-free, white to off-white lyophilized powder in a single-dose vial.

4 CONTRAINDICATIONS

None.

5 WARNINGS AND PRECAUTIONS

5.1 Myelosuppression

In uncontrolled trials with SYNRIBO, patients with chronic phase and accelerated phase CML experienced NCI CTC (version 3.0) Grade 3 or 4 thrombocytopenia (85%, 88%), neutropenia (81%, 71%), and anemia (62%, 80%), respectively. Fatality related to myelosuppression occurred in 3% of patients in the safety population (N=163). Patients with neutropenia are at increased risk for infections, and should be monitored frequently and advised to contact a physician if they have symptoms of infection or fever.

Monitor complete blood counts weekly during induction and initial maintenance cycles and every two weeks during later maintenance cycles, as clinically indicated. In clinical trials myelosuppression was generally reversible and usually managed by delaying the cycle and/or reducing days of treatment with SYNRIBO [see Dosage and Administration (2.3) and Adverse Reactions (6.1)].

5.2 Bleeding

SYNRIBO causes severe thrombocytopenia which increases the risk of hemorrhage. In clinical trials with CP and AP CML patients, a high incidence of Grade 3 and 4 thrombocytopenia (85% and 88%, respectively) was observed. Fatality related to cerebral hemorrhage occurred in 2% of patients treated with SYNRIBO in the safety population.

Severe, non-fatal, gastrointestinal hemorrhages occurred in 2% of patients in the same population (N=163). Among the patients with chronic phase CML, 87% received 14 days of treatment during cycle 1. By cycles 2 and 3, the percentage of patients receiving 14 days of treatment decreased to 42% and 16%, respectively. Of the 91 patients who received at least 2 cycles of treatment, 79% (76/91) had at least 1 cycle delayed during the trials. The median number of days of cycle delays was greater for cycle 2 (17 days) and cycle 3 (25 days) when more patients were receiving induction cycles.

Adverse reactions were reported for 99% of the patients with chronic phase CML. A total of 18% of patients had adverse reactions leading to withdrawal. The most frequently occurring adverse reactions leading to discontinuation were pancytopenia, thrombocytopenia, and increased alanine aminotransferase (each 2%). A total of 87% of patients reported at least 1 Grade 3 or Grade 4 treatment emergent adverse reaction (Table 2).

5.3 Hyperglycemia

SYNRIBO can induce glucose intolerance. Grade 3 or 4 hyperglycemia was reported in 11% of patients in the safety population. Hyperosmolar non-ketotic hyperglycemia occurred in 1 patient treated with SYNRIBO in the safety population.

5.4 Embryo-Fetal Toxicity

SYNRIBO can cause fetal harm when administered to a pregnant woman. Omacetaxine mepesuccinate caused embryo-fetal death in animals. Females of reproductive potential should avoid becoming pregnant while being treated with SYNRIBO. There are no adequate and well-controlled studies of SYNRIBO in pregnant women. If this drug is used during pregnancy, or if the patient becomes pregnant while receiving this drug, the patient should be apprised of the potential hazard to the fetus [see Use in Specific Populations (8.1)].

6.2 Additional Data from Safety Population

The following adverse reactions were reported in patients in the SYNRIBO clinical studies of patients with chronic phase and accelerated phase CML at a frequency of 1% to less than 10%. Within each category, adverse reactions are ranked on the basis of frequency.

Cardiac Disorders: tachycardia, palpitations, acute coronary syndrome, angina pectoris, arrhythmia, bradycardia, ventricular extrasystoles.

Ear and Labyrinth Disorders: ear pain, ear hemorrhage, tinnitus.

Eye Disorders: cataract, vision blurred, conjunctival hemorrhage, dry eye, lacrimation increased, conjunctivitis, diplopia, eye pain, eyelid edema.

Gastrointestinal Disorders: stomatitis, mouth ulceration, abdominal distension, dyspepsia, gastroesophageal reflux disease, gingival bleeding, aphthous stomatitis, dry mouth, hemorrhoids, gastritis, gastrointestinal hemorrhage, melena, mouth hemorrhage, oral pain, anal fissure, dysphagia, gingival pain, gingivitis.

General Disorders and Administration Site Conditions: musculoskeletal inflammation, pain, chest pain, hyperthermia, influenza-like illness, catheter site pain, general edema, malaise.

Immune System Disorders: hypersensitivity.

Injury, Poisoning and Procedural Complications: contusion, transfusion reaction.

Metabolism and Nutrition Disorders: decreased appetite, diabetes mellitus, gout, dehydration.

Musculoskeletal and Connective Tissue Disorders: bone pain, myalgia, muscular weakness, muscle spasms, musculoskeletal chest pain, musculoskeletal pain, musculoskeletal stiffness, musculoskeletal discomfort.

Nervous System Disorders: dizziness, cerebral hemorrhage, paresthesia, convulsion, hypotension, lethargy, sciatia, burning sensation, dysaesthesia, tremor.

Psychiatric Disorders: anxiety, depression, agitation, confusional state, mental status change.

Renal and Urinary Disorders: dysuria.

Respiratory, Thoracic and Mediastinal Disorders: pharyngolaryngeal pain, nasal congestion, dysphonia, productive cough, rales, rhinorrhea, hemoptysis, sinus congestion.

Skin and Subcutaneous Tissue Disorders: erythema, pruritus, dry skin, petechiae, hyperhidrosis, night sweats, ecchymosis, purpura, skin lesion, skin ulcer, rash erythematous, rash papular, skin exfoliation, skin hyperpigmentation.

Vascular Disorders: hematoma, hypertension, hot flush, hypotension.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Category D [see Warnings and Precautions (5.4)]

Risk Summary

Based on its mechanism of action and findings from animal studies, SYNRIBO can cause fetal harm when administered to pregnant women. If this drug is used during pregnancy, or if the patient becomes pregnant while taking this drug, the patient should be apprised of the potential hazard to a fetus.

Animal Data

In an embryo-fetal development study, pregnant mice were administered omacetaxine mepesuccinate subcutaneously during the period of organogenesis at doses of 0.21 or 0.41 mg/kg/day. Drug-related adverse effects included embryonic death, an increase in unossified bones/reduced bone ossification and decreased fetal body weights. Fetal toxicity occurred at doses of 0.41 mg/kg (1.23 mg/m²) which is approximately half the recommended daily human dose on a body surface area basis.
8.3 Nursing Mothers
It is not known whether omacetaxine mepesuccinate is excreted in human milk. Because many drugs are excreted in human milk and because of the potential for serious adverse reaction in nursing infants, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

8.4 Pediatric Use
The safety and effectiveness of SYNRIBO in pediatric patients have not been established.

8.5 Geriatric Use
In the chronic and accelerated phase CML efficacy populations 23 (30%) and 16 (46%) patients were ≥65 years of age. For the age subgroups of <65 years of age and ≥65 years of age, there were differences between the subgroups, with higher rates of major cytogenetic responses (MCyR/Rs) in younger patients with CP CML compared with older patients (23% vs. 9%, respectively) and higher rates of major hematologic responses (MRs) in younger patients compared with AP CML compared with younger patients (31% vs. 0%, respectively). Patients ≥65 years of age were more likely to experience toxicity, most notably hematologic toxicity.

8.6 Effect of Gender
Of the 76 patients included in the chronic phase CML population efficacy analysis, 47 (62%) of the patients were men and 29 (38%) were women. For patients with chronic phase CML, the MCyR rate in men was higher than in women (21% vs. 14%, respectively). There were differences noted in the safety profile of omacetaxine mepesuccinate in men and women with chronic phase CML although the small number of patients in each group prevents a definitive assessment. There were inadequate patient numbers in the accelerated phase subset to draw conclusions regarding a gender effect on efficacy.

10 OVERDOSAGE
A patient in the clinical expanded access program received an overdose of 2.5 mg/m² twice daily for 5 days in the 16th cycle. The patient presented with gastrointestinal disorders, gingival hemorrhage, alopecia, and Grade 4 thrombocytopenia and neutropenia. When SYNRIBO treatment was temporarily interrupted the gastrointestinal disorders and hemorrhagic syndrome resolved, and neutrophil values returned to within normal range. The alopecia and thrombocytopenia (Grade 1) improved, and SYNRIBO was restarted.

No specific antidote for SYNRIBO overdose is known. Management of overdose should include general supportive measures, including monitoring of hematologic parameters.

11 DESCRIPTION
SYNRIBO contains the active ingredient omacetaxine mepesuccinate, a cephalotaxine ester. It is a protein synthesis inhibitor. Omacetaxine mepesuccinate is prepared by a semi-synthetic process from cephalotaxine, an extract from the leaves of Cephalotaxus sp. The chemical name of omacetaxine mepesuccinate is cephalotaxine, 4-methyl (2R)-hydroxy-2-(4-hydroxy-4-methylpentyl)butanedioate (ester).

Omacetaxine mepesuccinate has the following chemical structure:

The molecular formula is C_{59}H_{89}NO_{15}, with a molecular weight of 545.6 g/mol. SYNRIBO for Infection is a sterile, preservative-free, white to off-white, lyophilized powder in a single-dose vial. Each vial contains 3.5 mg omacetaxine mepesuccinate and mannitol.

SYNRIBO is intended for subcutaneous administration after reconstitution with 1.0 mL of 0.9% Sodium Chloride Injection, USP. The pH of the reconstituted solution is between 5.5 and 7.0.

12 CLINICAL PHARMACOLOGY
12.1 Mechanism of Action
The mechanism of action of omacetaxine mepesuccinate has not been fully elucidated but includes inhibition of protein synthesis and is independent of direct Bcr-Abl binding. Omacetaxine mepesuccinate binds to the A-site cleft in the peptidyltransferase center of the large ribosomal subunit from a strain of archaeabacteria. In vitro, omacetaxine mepesuccinate reduced protein levels of the Bcr-Abl oncoprotein and Mcl-1, an anti-apoptotic Bcl-2 family member. Omacetaxine mepesuccinate showed activity in mouse models of wild-type and T315I mutated Bcr-Abl CML.

12.2 Pharmacodynamics
Cardiac Electrophysiology
In an uncontrolled pharmacokinetic study there were no reports of QTcF > 480 ms or ΔQTcF > 60 ms in 21 treated patients who received omacetaxine mepesuccinate 1.25 mg/m² BID for 14 consecutive days. There was no evidence for concentration-dependent increases in QTc for omacetaxine mepesuccinate or 4’-DMHHT. Although the mean effect on QTc was 4.2 ms (upper 95% CI: 9.5 ms), QTc effects less than 10 ms cannot be verified due to a absence of a placebo and positive controls.

12.3 Pharmacokinetics
The dose proportionality of omacetaxine mepesuccinate is unknown. A 90% increase in systemic exposure to omacetaxine mepesuccinate was observed between the first dose and steady state.
SYNRIBO® (omacetaxine mepesuccinate) for injection

Table 5: Efficacy Results Evaluated by DMC for Patients with CP CML

<table>
<thead>
<tr>
<th>Primary Response – MCyR</th>
<th>Patients (N=76)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total with MCyR, n (%)</td>
<td>14 (18.4)</td>
</tr>
<tr>
<td>95% confidence interval</td>
<td>(10.5% – 29.0%)</td>
</tr>
</tbody>
</table>

Cytogenetic response evaluation is based on standard cytogenetic analysis (at least 20 metaphases). Complete: 0% Ph+ cells, Partial > 0% to 35% Ph+ cells

The mean time to MCyR onset in the 14 patients was 3.5 months. The median duration of MCyR for the 14 patients was 12.5 months (Kaplan-Meier estimate).

Accelerated Phase CML (AP CML)

A total of 35 patients with accelerated phase CML were included in the efficacy analysis. The demographics were: median age was 63 years, 57% were male, 46% were 65 years of age or older, 68% were Caucasian, 23% were African-American, 3% were Asian and 3% were Hispanic. Twenty-two (63%) of 35 patients with accelerated phase had failed treatment with imatinib, dasatinib, and nilotinib. Most patients had also received prior non-TKI treatments, most commonly hydroxyurea (43%), interferon (31%), and/or cytarabine (29%). The efficacy endpoint was assessed based on MCyR and MaHR (complete hematologic response [CHR] or no evidence of leukemia [NEL]). The efficacy results for the patients with accelerated phase as adjudicated by the DMC are shown in Table 6.

Table 6: Efficacy Results Evaluated by DMC for Patients with AP CML

<table>
<thead>
<tr>
<th>Primary Response – MaHR</th>
<th>Patients (N=35)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total with MaHR, n (%)</td>

<td>(4.5% – 30.3%)</td>
</tr>
<tr>
<td>CHR</td>
<td>4 (11.4)</td>
</tr>
<tr>
<td>NEL</td>
<td>1 (2.9)</td>
</tr>
</tbody>
</table>

MaHR is defined as complete hematologic response (CHR) or no evidence of leukemia (NEL): CHR - absolute neutrophil count < 1.5 x 10^9/liter, platelets < 100 x 10^9/liter, no blood blasts, bone marrow blasts < 5%, no extramedullary disease; NEL - Morphologic leukemia-free state, defined as <5% bone marrow blasts.

The mean time to response onset in the 5 patients was 2.3 months. The median duration of MaHR for the 5 patients was 4.7 months (Kaplan-Meier estimate).

15 REFERENCES

16 HOW SUPPLIED/STORAGE AND HANDLING

16.1 How Supplied
SYNRIBO (omacetaxine mepesuccinate) for Injection is supplied in 8 mL clear glass single-dose vial in individual cartons. Each vial contains 3.5 mg of SYNRIBO (omacetaxine mepesuccinate) for Injection (NDC 63459-177-14).

16.2 Storage and Handling
Store unopened vials at 20°C to 25°C (68°F to 77°F); excursions permitted from 15°C to 30°C (59°F to 86°F) [see USP Controlled Room Temperature]. Prior to reconstitution, keep product in carton to protect from light. Omacetaxine mepesuccinate is a cytotoxic drug. Follow special handling and disposal procedures.

17 PATIENT COUNSELING INFORMATION
Availability of Medication Guide and Instructions for Use
Advise the patient and/or caregiver to read the FDA-approved patient labeling (Medication Guide and Instructions for Use). Assist patients and caregivers in understanding their contents and give them the opportunity to discuss the contents of the Medication Guide and Instructions for Use and to obtain answers to any questions they may have prior to initiating therapy. The complete text of the Medication Guide and Instructions for Use are attached to the prescribing information.

Patient Training
Once it is determined that a patient is an appropriate candidate for self-administration or administration by a caregiver, ensure that patients receive the necessary supplies for home administration of SYNRIBO and train them on the following [see Dosage and Administration (2.4, 2.5, 2.6, 2.7)]:

- How to transport reconstituted SYNRIBO in a secure container or packaging and under recommended temperature conditions
- Acceptable storage conditions and use times for reconstituted SYNRIBO
  - When stored in a refrigerator (2°C to 8°C [36°F to 46°F]), use within 6 days (144 hours)
  - When stored at room temperature (not to exceed 25°C [77°F]), use within 12 hours

SYNRIBO® (omacetaxine mepesuccinate) for injection

- If stored in a refrigerator, keep SYNRIBO from coming into contact with food or drink.
- To wear disposable gloves and protective eyewear when handling SYNRIBO.
- To wash hands before putting on gloves and after removing gloves.
- Not to eat or drink while handling SYNRIBO. To administer SYNRIBO in an area away from food or food preparation areas.
- To administer SYNRIBO in a location away from children and pregnant women.
- Proper subcutaneous injection technique including acceptable sites.
- The importance of body site selection for administering the injection, as well as the importance of alternating the injection sites. Advise patients to not inject SYNRIBO into areas of the skin that are tender, red, bruised, hard, or that have scars or stretch marks.
- In the case of a missed dose: If a patient misses an injection, skip the missed dose and the patient should give the next scheduled injection at the next scheduled time. Inform patients NOT to give two injections to make up for a missed injection.
- In the case that SYNRIBO comes into contact with a patient’s skin or eyes: Advise patients to wash exposed skin with soap and water and in the case of eye exposure, thoroughly flush the eye with water. After washing or flushing, advise patients to call their healthcare provider immediately.
- In the case that too much SYNRIBO is injected or that SYNRIBO is accidentally swallowed: Instruct patients to contact their healthcare provider immediately if they have injected too much SYNRIBO, or if someone has swallowed SYNRIBO.
- Disposal procedures, including use of an appropriate biohazard container and return of the container to the clinic or pharmacy for final disposal. Inform patients NOT to recap or clip the used needle and not to place used needles, syringes, vials, and other used supplies in a household trash or recycle container.
- Accidental spillage procedures, including wiping the spilled liquid with the absorbent pad (using protective eyewear and gloves), washing the area with water and soap, and proper disposal of materials.

Myelosuppression
Advise patients of the likelihood that SYNRIBO will cause a decrease in white blood cells, platelets, and red blood cells and that monitoring of these parameters will be needed. Instruct patients to contact a health care professional if they develop a fever, or other signs/symptoms of infection; shortness of breath, significant fatigue, or bleeding [see Warnings and Precautions (5.1)].

Bleeding
Advise patients of the possibility of serious bleeding due to low platelet counts. Instruct patients to report immediately any signs or symptoms suggestive of hemorrhage (unusual bleeding, easy bruising or blood in urine or stool; confusion, slurred speech, or altered vision). Instruct patients to report in advance if they plan to have any dental or surgical procedures [see Warnings and Precautions (5.2)].

Hyperglycemia
Advise patients with diabetes of the possibility of hyperglycemia and the need for careful monitoring of blood glucose levels. Patients with poorly controlled diabetes mellitus should not be treated with omacetaxine mepesuccinate until good glycemic control has been established [see Warnings and Precautions (5.3)].

Pregnancy and Nursing
Advise patients that omacetaxine mepesuccinate can cause fetal harm when administered to a pregnant woman. Advise females of reproductive potential of the potential hazard to the fetus and to avoid becoming pregnant [see Warnings and Precautions (5.4)]. Advise females to avoid nursing while receiving SYNRIBO [see Use in Specific Populations (8.3)].

Gastrointestinal Distress
Advise patients that they may experience nausea, diarrhea, abdominal pain, constipation, and vomiting. If these symptoms persist, they should seek medical attention.

Fatigue
Advise patients that SYNRIBO may cause fatigue and to avoid driving any vehicle or operating any dangerous tools or machinery if they experience this side effect.

Bleeding
Advise patients that they may experience skin rash. Advise patients to immediately report severe or worsening rash or itching.

Alopecia
Advise patients that they may experience hair loss.

SYNRIBO® (omacetaxine mepesuccinate) for injection

MEDICATION GUIDE
SYNRIBO® (sin-RYE-bo)
(omacetaxine mepesuccinate)
for injection, for subcutaneous use

Read this Medication Guide before you start using SYNRIBO and each time you get a refill. There may be new information. This information does not take the place of talking to your healthcare provider about your medical condition or treatment.

What is the most important information I should know about SYNRIBO?

SYNRIBO can cause serious side effects including:
Low blood counts. Low blood counts are common when using SYNRIBO, including low red blood cells, white blood cells, and platelets, and can be severe. If your white blood cell count becomes very low, you are at increased risk for infection which can lead to death. Your healthcare provider will check your blood counts regularly during treatment with SYNRIBO. Tell your healthcare provider right away if you get any of the following symptoms:
• fever
• chills
• body aches
• feeling very tired
• shortness of breath
• bleeding (see below)

Bleeding. SYNRIBO causes severe low platelet counts that may increase your risk of severe bleeding. Severe low platelet counts can cause you to have bleeding in your brain or severe stomach bleeding, that can lead to death. Your healthcare provider will check your platelet counts regularly during treatment with SYNRIBO. Tell your healthcare provider right away if you get any of the following symptoms:
• unusual bleeding
• easy bruising
• blood in urine or stool
• confusion
• slurred speech
• vision changes

See “What are the possible side effects of SYNRIBO?” for more information about side effects.

What is SYNRIBO?

SYNRIBO is a prescription medicine used to treat adults with a type of blood cancer (leukemia) called chronic myeloid leukemia (CML):
• that is in the chronic phase or accelerated phase, and
• who have not responded to (resistant) or cannot tolerate 2 or more medicines called tyrosine kinase inhibitors.

It is not known if SYNRIBO is safe and effective in children.

What should I tell my healthcare provider before using SYNRIBO?

Before using SYNRIBO, tell your healthcare provider if you:
• have diabetes or a family history of diabetes
• have bleeding problems
• plan to have any dental or surgical procedures
• have any other medical problems
• are pregnant or plan to become pregnant. SYNRIBO can harm your unborn baby. You should not become pregnant during treatment with SYNRIBO. Tell your healthcare provider right away if you become pregnant during treatment with SYNRIBO.
• are breastfeeding or plan to breastfeed. It is not known if SYNRIBO passes into your breast milk. You and your healthcare provider should decide if you will take SYNRIBO or breastfeed. You should not do both.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements.
Know the medicines you take. Keep a list of them to show your healthcare provider and pharmacist when you get a new medicine.

How should I use SYNRIBO?

• Follow the detailed Instructions for Use at the end of this Medication Guide for information about the right way to:
  ◦ properly handle and inject SYNRIBO
  ◦ dispose of used supplies for injecting SYNRIBO
  ◦ clean up any spilled SYNRIBO

• Your healthcare provider will tell you how much SYNRIBO to inject and the timing of when to inject it. Inject SYNRIBO exactly as prescribed.
• Do not change your dose or the timing of when you inject SYNRIBO, unless your healthcare provider tells you to.
• SYNRIBO is given as an injection under the skin (subcutaneous injection) of your thigh or stomach-area (abdomen). The injection can be given in the back of the arm if a caregiver is giving the injection.
• If your healthcare provider decides that you or a caregiver can inject SYNRIBO, your healthcare provider will show you or your caregiver how to prepare for an injection and how to inject SYNRIBO before you use it for the first time.
• SYNRIBO is injected 2 times each day, about every 12 hours.
• Your healthcare provider may tell you to stop using SYNRIBO for a period of time, or tell you to use SYNRIBO less often depending on the side effects that you get.
• Your healthcare provider will arrange for you to receive syringes filled with SYNRIBO that are ready to inject, along with the other supplies that you will need to inject SYNRIBO. Each syringe contains 1 dose of SYNRIBO as prescribed by your healthcare provider.
• Follow your healthcare provider’s instructions for how to carry (transport) SYNRIBO using ice packs or a cooler.
• Do not eat or drink while handling SYNRIBO.
• You or your caregiver should wear gloves and protective eyewear, for example protective eyeglasses (not regular eyeglasses) or face shield when handling SYNRIBO and while giving your injection.
• If you or your caregiver get SYNRIBO on your skin, wash the area with soap and water.
• If you or your caregiver get SYNRIBO in your eyes, flush your eyes with water and call your healthcare provider right away.
• If you miss a dose of SYNRIBO, just skip the missed dose. Give your next injection of SYNRIBO at your next scheduled time. Do not give 2 doses of SYNRIBO at the same time to make up for a missed dose.
• If you inject too much SYNRIBO, call your healthcare provider or go to the nearest emergency room right away. Follow your healthcare provider’s instructions for when you should inject your next dose of SYNRIBO.
• If another person accidentally injects themself with SYNRIBO, or if anyone accidentally swallows SYNRIBO, call your doctor or get emergency help right away.

What should I avoid while using SYNRIBO?

SYNRIBO may cause tiredness. Avoid driving, or operating dangerous tools or machinery if you develop tiredness when using SYNRIBO.

What are the possible side effects of SYNRIBO?

SYNRIBO may cause serious side effects, including:
• See “What is the most important information I should know about SYNRIBO?”
• High blood sugar levels (hyperglycemia). SYNRIBO can cause high blood sugar levels. If you have diabetes or are at risk for diabetes, your healthcare provider will check your blood glucose levels often during treatment with SYNRIBO. If you have diabetes or if your blood sugar is not well controlled, your healthcare provider may decide not to start treatment with SYNRIBO until your diabetes is under control first.
The most common side effects of SYNRIBO are:

- Infections. See the information about low blood cell counts in the section “What is the most important information I should know about SYNRIBO?”
- diarrhea
- nausea
- tiredness
- weakness
- redness, swelling, or pain at injection site

Tell your healthcare provider if you have any side effect that bothers you or that does not go away.

These are not all of the side effects of SYNRIBO. For more information, ask your healthcare provider or pharmacist.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store SYNRIBO?

- Carry (transport) SYNRIBO as instructed by your healthcare provider. It is important to use ice packs or a cooler.
- When stored in a refrigerator 36°F to 46°F (2°C to 8°C), use SYNRIBO within 6 days from when it was mixed.
- When stored at room temperature, 68°F to 77°F (20°C to 25°C), use SYNRIBO within 12 hours from when it was mixed.
- When stored in a refrigerator, keep SYNRIBO from coming into contact with food or drink.

Keep SYNRIBO and all medicines out of the reach of children.

General information about the safe and effective use of SYNRIBO.

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use SYNRIBO for a condition for which it was not prescribed. Do not give SYNRIBO to other people even if they have the same symptoms you have. It may harm them. If you would like more information, talk with your healthcare provider. You can ask your healthcare provider or pharmacist for information about SYNRIBO that is written for health professionals.

For more information, go to www.synribo.com or call Teva at 1-800-896-5855.

What are the ingredients in SYNRIBO?

Active ingredient: omacetaxine mepesuccinate

Inactive ingredients: mannitol

This Medication Guide has been approved by the U.S. Food and Drug Administration.

SYNMG-001
Issued: April 2014

Instructions for Use

SYNRIBO® (sin-rye-bo)
(omacetaxine mepesuccinate)
for injection, for subcutaneous use

Read this Instructions for Use before you inject SYNRIBO for the first time and each time you get a refill. Also read the Medication Guide for SYNRIBO.

Before you or your caregiver injects SYNRIBO, your healthcare provider will show you how to properly:

- handle syringes and inject SYNRIBO
- dispose of used supplies for injecting SYNRIBO
- clean up any spilled SYNRIBO

Important:

- Be sure that you store SYNRIBO exactly as your healthcare provider tells you to. See the section “How should I store SYNRIBO?” in the Medication Guide.

- Never try to re-cap the needle. This could cause a needle-stick injury.
- If SYNRIBO comes into contact with your skin, wash the area well with soap and water.

Your healthcare provider will arrange for you to receive all of the supplies that you will need for each injection of SYNRIBO:

- syringe with attached needle, containing SYNRIBO for injection
- protective eyewear, such as protective eyeglasses (not regular eyeglasses) or face shield
- gloves
- disposal biohazard container
- absorbent pads for use to clean up an accidental spill of SYNRIBO
- alcohol swabs
- gauze pads

You may also need an adhesive bandage.

Never mix SYNRIBO yourself. If you don’t receive syringes already filled with SYNRIBO, contact your doctor or pharmacy.

Step 1. Preparing to give an injection of SYNRIBO.

- Find a clean flat work surface.
- Wash your hands well with soap and water.
- Put on a pair of gloves and your protective eyewear before you handle the syringe containing SYNRIBO. Wearing gloves and protective eyewear (even if you wear glasses) protects you from splashes or spills. See Figure A.
- Look at the date printed on the syringe label to make sure that the expiration date has not passed. Do not use if the expiration date has passed and contact your doctor or pharmacy immediately.
- Gather the rest of your supplies and place them on your work surface.

Step 2. Choose an injection site.

- You may inject SYNRIBO into your thigh or stomach-area (abdomen). See Figure B. The injection can be given in the back of your arm if a caregiver is giving the injection. See Figure C.
- Use a different site for each injection to help decrease tenderness at the injection site. Each injection site should be at least 1 inch away from any recently used injection site.
- Do not inject SYNRIBO into areas of your skin that are tender, red, bruised, hard, or that have scars or stretch marks.
Step 3. Prepare the injection site.
- Clean the injection site well with an alcohol wipe and allow it to air dry. See Figure D.

Step 4. Inject SYNRIBO.
- Carefully remove the needle cap by pulling, taking care not to stick yourself. See Figure E.
- Do not press down on the plunger.
- With one hand, pinch skin of injection site between your thumb and forefinger. See Figure F.
- With your other hand, hold the syringe at a 45 degree or 90 degree angle to your skin. Use a quick dart-like motion to insert the needle through the skin at the injection site. See Figures G and H. The needle should go through the skin but not into your muscle.
- Slowly push down on the plunger with your thumb until syringe is empty. See Figure I.

How should I throw away (dispose of) used SYNRIBO syringes, needles, and other supplies?
- Follow the instructions below for how to dispose of the syringe, needle, and other supplies used to give your injection. Never try to re-cap the needle. This could cause a needle-stick injury.
- Remove your gloves. Wash your hands right away with soap and water, and then remove your protective eyewear.

What should I do in case of an accidental SYNRIBO spill?
- Your healthcare provider will arrange for you to receive supplies to use in case you spill SYNRIBO.
- Follow your healthcare provider’s instructions about how to clean up a SYNRIBO spill.
- Do not touch a spill unless you are wearing gloves and protective eyewear.
- Use an absorbent pad to wipe up the spill. Wash the area with soap and water. Use an extra absorbent pad or paper towel to dry the area.
- Place the pad, gloves, and other supplies that were used to clean the spill in the biohazard container.
- Call your healthcare provider right away to report the spill.

This Instructions for Use has been approved by the U.S. Food and Drug Administration.
